

Reactive Programming : LiveData

Tobias

Growth Session #23 - March 21-22 2019

Introduction - What is LiveData ?

LiveData is an **observable data holder** :

1. The **UI** observes the livedata object = The **UI** wants to be notified of updates
2. The **data** in LiveData changes
3. The **UI** gets notified, so the **UI** will update itself with the new data

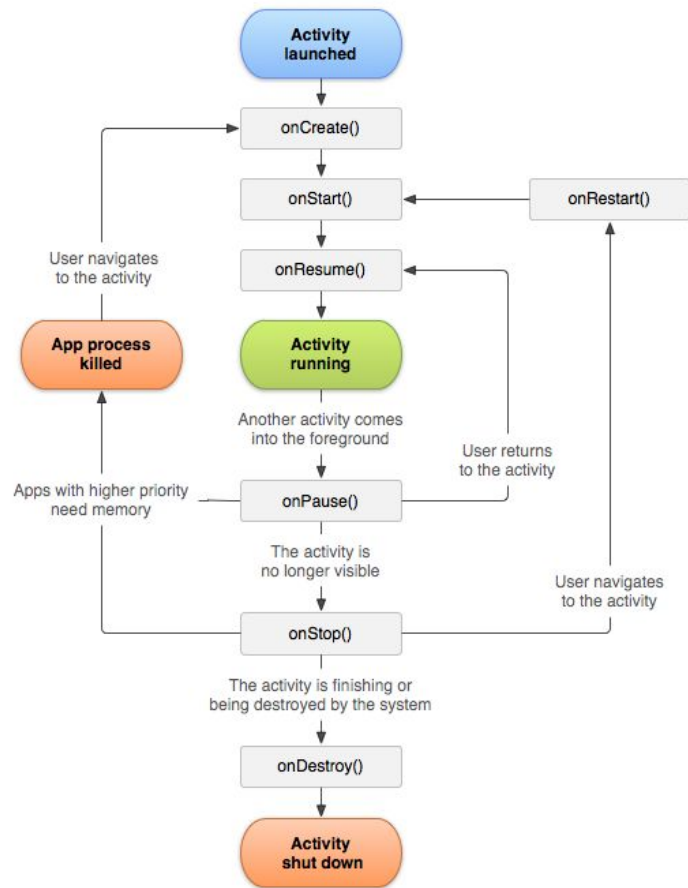

→ LiveData makes it easy to keep what's going on on screen & sync with our data!

Activity Lifecycle - Why should we use LiveData?

- An activity represents a single screen
- An app is a collection of **one** or **more** activities
- An activity can go through different **states/transitions**

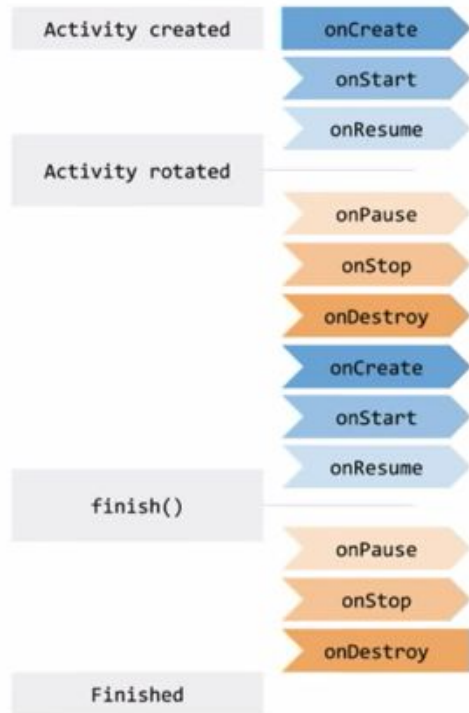

- ★ onCreate() = Created
- ★ onStart() = Started
- ★ onResume() = Resumed
- ★ ...
- ★ onStop() = Stopped
- ★ onDestroy() = Destroyed

Motivation - Why should we use LiveData?

LiveData is an observable data holder, but it is **lifecycle** aware!

- No memory leaks
 - When an activity is destroyed, it cleans up after itself
- No crashes due to stopped activities
 - If the activity is inactive, no LiveData events will be sent
- No more manual lifecycle handling
 - Lifecycle management is automated
- Always up-to-date data
 - If activity is active again, from being inactive, it will get the latest data
- Proper configuration changes
 - If activity undergoes a configuration change, it will get the latest data
- Sharing resources
 - LiveData can be extended as a singleton object, that can be shared in your app

Differences with RxJava

LiveData

```
private val counter = MutableLiveData<Int>()
```

```
counter.value = 1
```

LiveData only has two built-in operators:

→ Map, SwitchMap & Mediator

If your operations are lifecycle **dependent**?

RxJava

```
private val counter = BehaviourSubject.create<Int>()
```

```
counter.onNext(1)
```

RxJava has a lot of built-in operators

→ Map, FlatMap, Filter, Delay, SkipUntil, ...

If you need a lot of **operators**?

Which one is better? Use **both**!

DEMO

Thanks!
